1 Introduction

This report describes the **Computerised Database of the Household Survey** carried out for the Socio-economic Baseline Study (SEBS) of the Land Titling Project-1. The survey was undertaken in July and August 2003 in 1,000 households in 40 villages in Vientiane Municipality and seven of the eight Provinces served by LTP-1 (see Table 1.1).

This report contains the following sections:

- Introduction
- Data entry
- Data quality
- Data Structure and Organisation
- SEBS 2003 Data CD - Content
- Annexes

This report is accompanied by the **SEBS 2003 Data CD** which, in addition to the Household Survey Database, contains all raw data originally produced by the SEBS Baseline Survey and Case Studies.

From the Baseline Survey, the following data is included:

- Household Survey Database (Household Questionnaire)¹
- Nai Ban Key Informant Interview data (Nai Ban Questionnaire)
- Housing and Urban Planning Key Informant Interview data (H&UP Questionnaire)
- Wealth Ranking data
- Conflict Ranking data

From the Case Studies, the following data is included:

- Records of focus group discussions

Disclaimer:

The “SEBS 2003 Data CD” contains confidential information which is for official use only. To protect the confidentiality of the informants, the data should not be distributed to unauthorised users.

¹ The questionnaires used in the SEBS are presented in Annex B.

2 Data Entry

2.1 Data Entry Period

Data entry has been carried out in parallel with the fieldwork activities of the survey, starting on the 15 July 2003. The entry of all 1,000 household questionnaires was completed on the 12 August 2003.

2.2 Data Entry Application

The Census and Survey Processing system (**CSPro 2.3**) has been used as the data entry and editing programme. **CSPro** is a Windows based package for entry, editing, cross-tabulation, and dissemination of census and survey data.

The data is stored in an ASCII text file described by a data dictionary. CSPro contains a powerful common procedure language to implement data entry control and edit rules. CSPro also provides tools to view data and other text files, to view tables and thematic maps created by CSPro, and to convert ESRI shape files (maps) to CSPro map files. CSPro was developed jointly by the U.S. Census Bureau, Macro International, and Serpro, SA, with major funding from the U.S. Agency for International Development. CSPro is in the public domain. It is available at no cost and may be freely distributed.

2.3 Data Entry Procedures

The objective of the data entry operation is to convert the raw material (the information on the paper questionnaires) into an intermediate product (machine-readable files) that needs to be further refined (by means of editing programs and clerical processes) in order to obtain a so-called “clean” database as a final product.

The questionnaires were returned back from the field to the office on a regular basis (daily or at least twice per week) for data entry. All survey data have been entered into the computer at the consultant's office in Vientiane by two computer operators who received special training for this task. The data operators have been familiarised with the structure and content of the questionnaire and with the data entry application itself, thus ensuring that the information on the data file perfectly reflects the information gathered in the questionnaires.

The whole data entry process has been closely supervised by the project's Data Quality Controller and Data Manager.

3 Data Quality

3.1 Data Checking Procedures

A **five step quality control process** has been applied to each questionnaire to ensure that the data contained in the database is reliable and clean. Questionnaires have been frequently reviewed and errors could be detected at early stages. As errors have been detected, data cleaning procedures have been enforced at each stage to correct erroneous values with frequent reference back to the actual questionnaires and/or the enumerators, for confirmation and checking. The quality control process involved:

1. **Field data checking** to correct sampling errors before the questionnaires returned to the central office.
2. **Pre-entry data checking** and translation of open-ended questions into English prior to data entry. Unacceptable questionnaires returned to the enumerator for correction.
3. **Automated checks** during data entry to reduce non-sampling errors.
4. **Validation** by double-entering 75 % of all questionnaires and subsequent checking for miscoded values.
5. **Data cleaning** of the coded data using batch processing routines on the digital dataset.

3.2 Data Quality Assessment

Both, sampling and non-sampling errors have been reduced to a minimum level by applying the following commonly used control criteria:

- Range checks
- Skip checks
- Consistency checks
- Typographic checks

As a result of these quality control mechanisms all data gathered in the survey and contained in the present dataset are of very high quality.

The overall number of all responses given in the 1,000 questionnaires is 78,968. Of these, only 29 missing or not responded values have been recorded. Only 1.1 percent of all answers have been responded by “Don’t know”. **Table 3.1** gives an overview of the completeness of the database. A comprehensive “Error Assessment Table” for all 131 questions in the questionnaire is presented in **Annex C**.

Table 3.1: Completeness of Survey Data

| Responses | Number | Percentage |
|----------------------------|--------|------------|
| Total responses given | 78,968 | 100.00 % |
| Valid responses | 78,068 | 98.88 % |
| “Don’t know” answers | 853 | 1.08 % |
| Missing values / no answer | 29 | 0.04 % |

4 Data Organisation and Structure

4.1 File format

The data is originally stored as a **fixed-format multiple-record ASCII text file**. ASCII (American Standard Code for Information Exchange) is a standard text format ensuring that the data can be used on virtually any computer system, independent from software or hardware configurations. Variables in the data file are **fixed format**, that is, items have the same starting position and length in every record where they occur. In addition to the ASCII text format, the data file is made available in two commonly used tabular data exchange formats: Tab delimited and Microsoft Excel spreadsheet, see Section 5 for details.

4.2 Multiple Record Format

The data file is a multiple-record data file. Several lines of data (and therefore several records) from the data file equate to one questionnaire. The relationship between records in the data file is established by the means of questionnaire identifiers (IDs). A sample file structure is presented in section 4.3.

Each record consists of three parts – two identifiers and the actual data values:

1. The first part is the **Record Type** which appears at the beginning of each record. It tells whether the information is, for example, from the reference section, the household section or revenue section of the questionnaire.

Table 4.1: Records

| Record Type | Record |
|-------------|------------------------------------|
| 1 | Reference |
| 2 | Household Profile |
| 3 | Household Assets & Land Ownership |
| 4 | Land Transactions |
| 5 | Community Co-operation |
| 6 | Land Conflicts |
| 7 | Household Decision-making Patterns |
| 8 | Credit |
| 9 | Land Use & Environment |
| A | Revenue |

2. The record type is followed – in all records – by the **Questionnaire ID**. Unique household identifiers have been used as questionnaire IDs throughout the whole survey. They have the form of *HH - Village Code - Enumerator-ID - Sequential Number* (Example: *HH-0101002-011-1*)
3. After the identifiers, the actual **Data values** recorded for each particular unit follow, recorded in fixed-length fields for each variable in the same order of the questions in the questionnaire. A variable describes the response to a question – age, income, and crop-code are all examples of variables. Missing values are coded using special values defined in the Data Dictionary. Not applicable fields are left blank in the data file.

4.3 Sample File Structure

For a given questionnaire there is one line for each record in the data file, thus making up 10 lines per questionnaire. Below a sample file structure is presented (not all fields are defined for this example):

Questionnaire 1

Questionnaire 2

In the example above:

Red text refers to the **Record Type**. In our example, 1 is a reference record, and 2 is a household profile record and so on.

Blue text refers to the **Questionnaire IDs**. Note that the numbers are unique for each questionnaire.

Black text contains the data values of the individual variables for each specific record.

4.4 Data Dictionary

The overall structure of the ASCII computer file is defined in the Data Dictionary (**Annex D**). The Data Dictionary is a required resource for any user interested in working with the dataset and should always be delivered together with the original data file.

The Data Dictionary clearly specifies the position and length of each variable in the record. For categorical variables, it also specifies the encoding.

Examples: 1 = Male, 2 = Female
1 = Yes, 2 = No, 3 = Don't know
-99 = Missing Value

The following definitions and descriptions are contained in the Data Dictionary:

- The overall structure of a data file,
- Meaningful names for records, variables, and values,
- Position in the data record,
- The type of data in a variable (numbers or text),
- Length of a variable,
- The number decimal places,
- Valid values or ranges of values,
- Other documentation.

5 SEBS 2003 Data CD - Content

Disclaimer:

The “SEBS 2003 Data CD” contains confidential information which is for official use only. To protect the confidentiality of the informants, the data should not be distributed to unauthorised users.

All data and correlated files of the SEBS are stored on a standard CD-ROM. The SEBS 2003 Data CD is included in this report as **Annex E**. The CD content is presented in the table below.

Note on file Formats:

ASCII Text (DAT) – Standard text format. No special database application is necessary for reading and manipulating the data. The fixed-length field format of the native structure is adequate for transferring the data to standard Database Management Systems (DBMS) for further manipulation, or to standard statistical software for tabulation and analysis.

Tab Delimited (TXT) – Text file with each value separated with a tab character. The first line of text contains labels for each variable separated by tabs. This format is useful for sending data to a variety of software such as spread sheet, text processors, or databases.

Microsoft Excel Format (XLS) –Proprietary file format used by the Microsoft Excel spreadsheet application. It can also be imported into a variety of other spreadsheet, statistical and database applications.

CSPRO Data Dictionary (DCF) – Data dictionary file used by CSPRO to manipulate the ASCII data files. Contains information defining the layout of a data file, including levels, records, items, value sets and values.

Data Dictionary (DIC) – Data Dictionary in ASCII text format, which may be viewed with any text editor, such the Windows Notepad.

Adobe PDF (PDF) – This file may be viewed with the Adobe Acrobat Reader (ACROBAT.EXE) included on the CD-ROM.

Q-START Hello. My name is and I am an interviewer for the Socio-Economic Baseline Study. My colleague(s), and I have been invited to visit your village and to ask you to help us get some important information which can be of interest to the Lao Land Titling Project which has been working in this district. It is very important for you to understand that, if you choose to help us with our survey, all the information you give us will be kept confidential to the SEBS survey. It will not be given to any other organisation or individuals outside of the Government of Lao PDR without your permission first. We look forward to a happy collaboration with completing our questionnaires. Before we begin, can you confirm that you live in this village? Do you understand that the following answers you give are about the whole of this household not just you personally? Do you have any questions about what we are here to do and how you can help us?

- background on LTP
- SEBS will establish (measure) present conditions
- a second survey will be carried out after a few years
- the difference between the two surveys will be LTP's impact
